

SPA

Load once,
The talk to the API

SPA

Plain JavaScript

Gets ugly fast

```
const page = document.createElement('div');
const title = document.createElement('h1');
const button = document.createElement('button');
const list = document.createElement('ul');

title.textContent = 'Products';
button.textContent = 'Load Reviews';

button.addEventListener('click', async () => {
  const response = await fetch('/api/reviews?productId=42');
  const reviews = await response.json();

  list.innerHTML = '';
  for (const review of reviews) {
    const item = document.createElement('li');
    item.textContent = review.text;
    list.appendChild(item);
  }
});

page.appendChild(title);
page.appendChild(button);
page.appendChild(list);
document.body.appendChild(page);
```

SPA

For DOM manipulation
to Templates

```
<section class="product-page">
  <h1>{{ product.title }}</h1>

  <button (click)="loadReviews(product.id)">
    Load Reviews
  </button>

  @if (reviews.length > 0) {
    <ul>
      @for (review of reviews; track review.id) {
        <li>{{ review.text }}</li>
      }
    </ul>
  }
</section>
```

Other frameworks solving the same SPA scaling challenge.

React

Vue

SPA

Templates and Binding
Client - side
